

Trumpet Creeper

Campsis radicans

Red-orange, showy trumpet-like flowers appear on this vine in clusters in the summer. The plant is known for its dense colonization potential, almost like a weed, as it grows through suckers. However, this can be good for erosion control, and hummingbirds adore the flowers. Aerial suckers allow it to climb, and care should be taken planting it along wood, stone, and brick. This plant is a host to the larvae of the Plebeian sphinx moth.

- Perennial
- Vining, grows tall!
- Found in woods, thickets, fields, roadsides
